Cross-Tissue Probe Threshold Transfer for Mechanistic Gene Regulatory Network Evaluation in Single-Cell Foundation Models

Ihor Kendiukhov, University of Tübingen

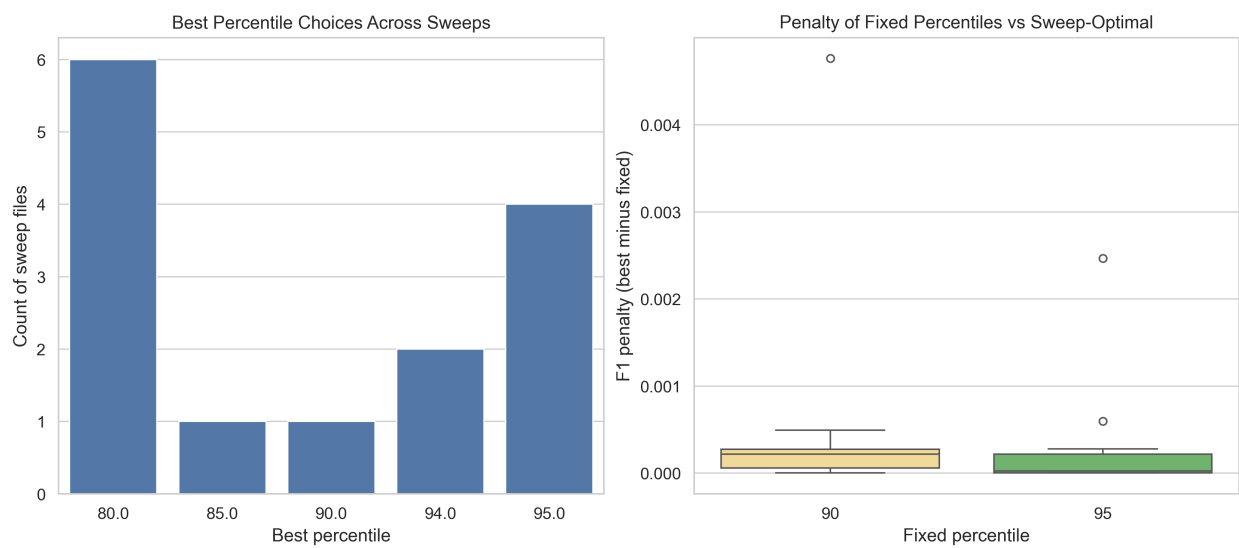

This document contains Supporting Information figures S1 Fig through S7 Fig, each referenced in the main text.

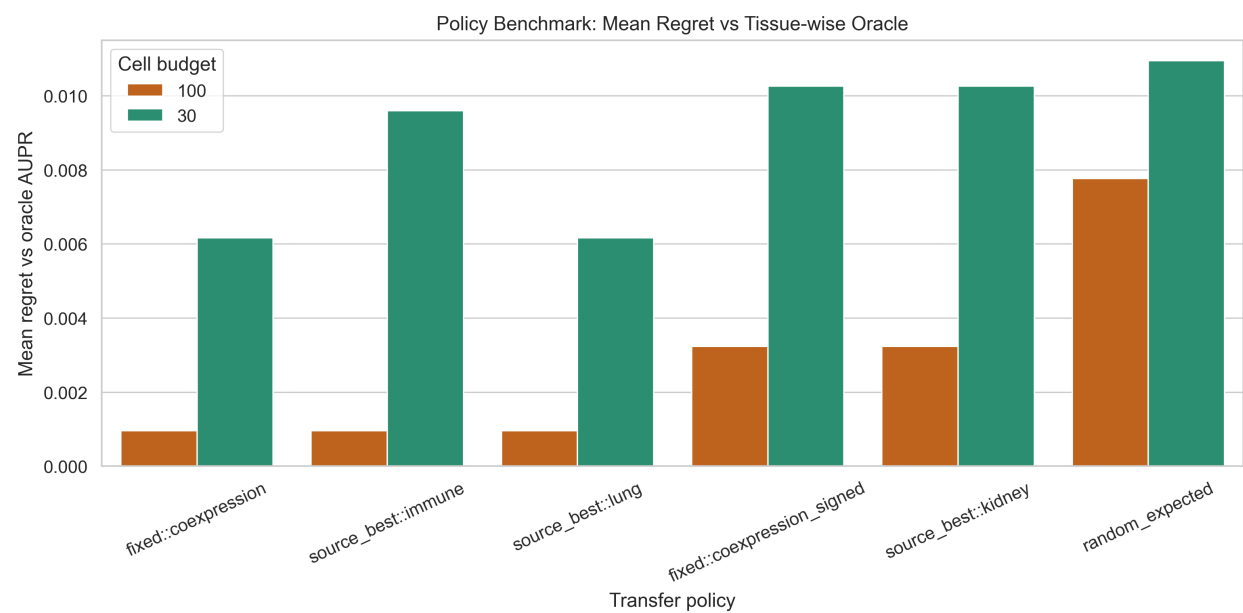

S1 Fig. Rank concordance across tissue-reference pairs. Spearman rank concordance of probe orderings between source and target contexts.

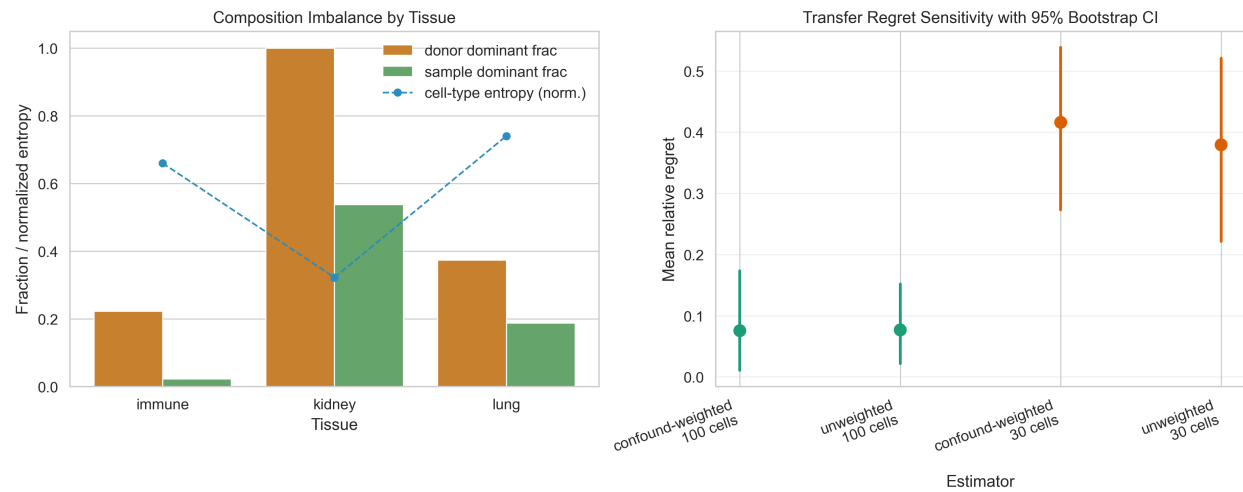

S2 Fig. Best-probe-by-reference matrix. Winning probe family for each tissue-reference combination across TR-RUST, DoRothEA, and DoRothEA ChIP-seq.

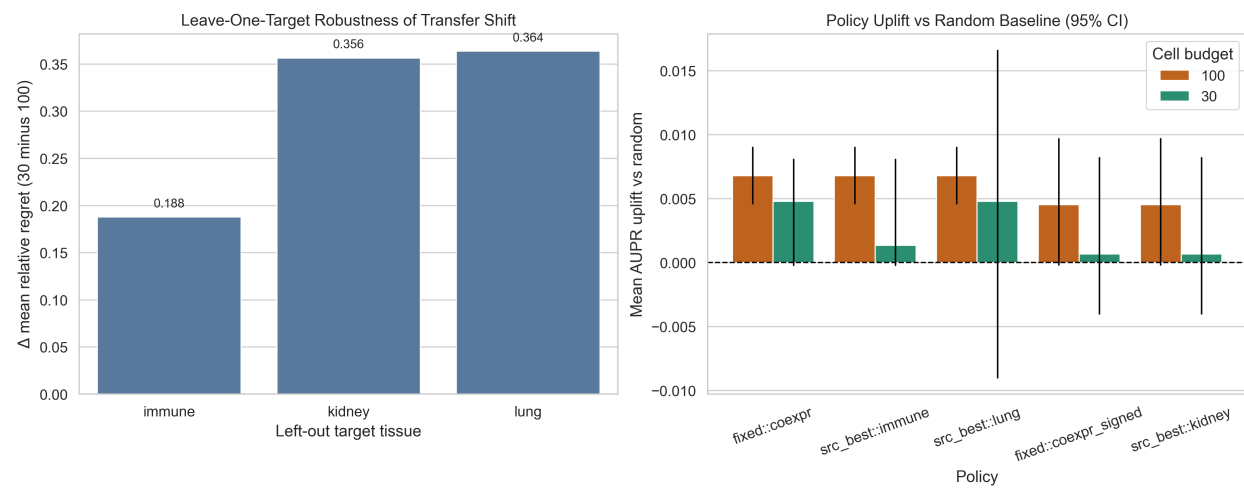

S3 Fig. Threshold robustness. Sensitivity of edge calls to the percentile threshold choice (p_{90} vs. p_{95}).

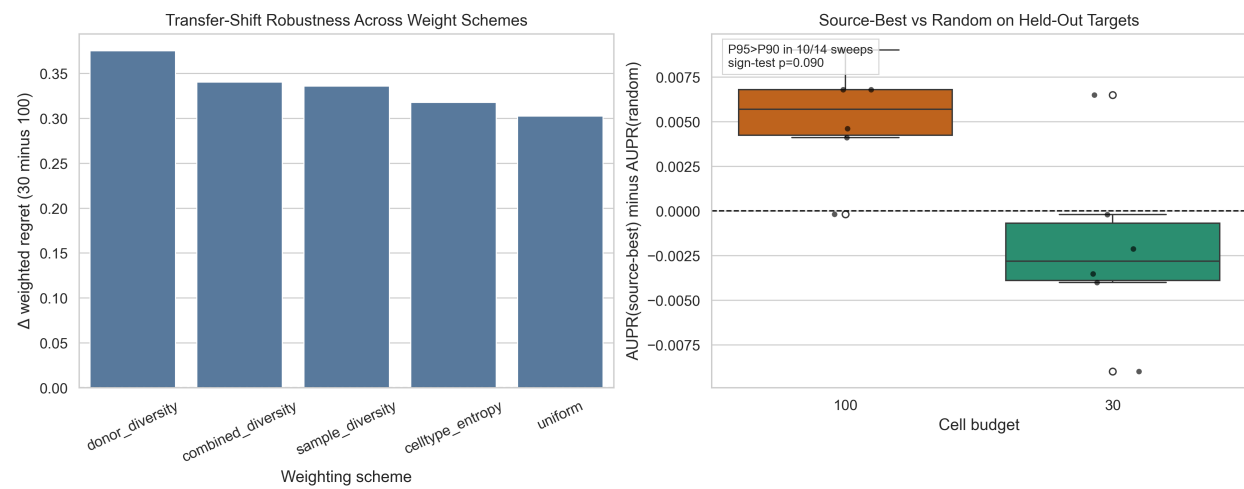

S4 Fig. Policy transfer benchmark. Source-best, fixed-probe, and random-expectation policies compared across cell budgets.

S5 Fig. Confound sensitivity. Robustness of transfer-regret estimates to potential confounds.

S6 Fig. Iterator stress tests. Stability of regret estimates under resampling of (source, target) tissue pairs.

S7 Fig. Iterator round-2 sensitivity. Second-round sensitivity analysis confirming robustness of the cell-budget phase transition.
